

ABSTRACT

5 A support bracket is adapted to secure wire fence elements to posts having T-shaped cross-sections with a leg and two cross-arms. The bracket includes a first slot adapted and constructed to receive a cross-arm of a fence post, and a second slot adapted and constructed to receive a cross-arm of the fence post, the second slot being generally aligned with the first slot. A third slot is adapted and constructed to receive a leg of the fence post, and is generally perpendicular to the first and second slots. The bracket can be mounted to the post in a first position in which the leg is received in the third slot, and a second position in which the leg extends opposite the third slot.
